Item	Value
Title	Improvement Axes — Salesforce CRM Platform
Reference	TAD-NWB-CRM-AX
Client	Northwind Bank
Integrator	Acme Integrators
Version	1.0 — For review
Date	2026-10-28
Classification	Confidential — fictional example
Scope	Salesforce organization (Production) of Northwind Bank, state as of 2026-10-28

1 Summary

The platform is small, readable and well layered. The main axes are about access and cleanliness rather than design:

1. **AX-01** Review the `ViewAllData` permission of `NWB_Support_Admin`.
2. **AX-02** Move the document store to a secured named credential with an external credential.
3. **AX-03** Decide on the components that look unused (`LegacyRateHelper`) and on the old API version.
4. **AX-04** Document the order of execution on `Lead`, where a trigger and a flow both act.
5. **AX-05** Add a description to every specific object.

1.1 Signals at a glance

Signal	Pillar	Priority	Observed	Evidence in the metadata
Apex and triggers on old API versions	Adaptable	P3	1	`LegacyRateHelper`
Classes declared without sharing	Trusted	P2	1	`CustomerSyncBatch`
Classes without a sharing keyword (inherit the caller's mode)	Trusted	P3	2	`LegacyRateHelper`, `SsoRegistrationHandler`
Few test classes compared to application classes	Trusted	P2	5/12	—
Record-triggered flows and Apex triggers on the same object	Adaptable	P3	1	`Lead:`
Profiles or permission sets with Modify/View All Data	Trusted	P2	1	`NWB_Support_Admin`
Legacy named credentials	Trusted	P3	1	`NWB_DocumentStore`
Custom objects without description	Easy	P3	1	`LoanDocument__c`
Components that look unused (to confirm)	Easy	P3	1	`apex`

2 Method

The signals below are **measured** on the metadata of the organization (and, when connected, on aggregated org facts). A signal is an observation, not a verdict: each one is qualified by the architect before it becomes an improvement axis.

- **Pillars** follow the Salesforce Well-Architected framework: *Trusted* (security, compliance, reliability), *Easy* (user experience, operations, intentional design) and *Adaptable* (maintainability, scalability, resilience to change).
- **Priorities**: P1 act now (risk for security, data or continuity); P2 plan in the next releases; P3 improve when touching the area.
- Each axis has an identifier `AX-nn`, reused in the register and in the roadmap.

This example was produced offline, from the metadata only: no Code Analyzer report and no org facts (coverage, volumes) were available.

3 Findings

3.1 Trusted — security, compliance, reliability

Signal	Priority	Observed	Evidence in the metadata
Classes declared without sharing	P2	1	`CustomerSyncBatch`
Classes without a sharing keyword (inherit the caller's mode)	P3	2	`LegacyRateHelper`, `SsoRegistrationHandler`
Few test classes compared to application classes	P2	5/12	—
Profiles or permission sets with Modify/View All Data	P2	1	`NWB_Support_Admin (ViewAllData)`
Legacy named credentials	P3	1	`NWB_DocumentStore`

- **Powerful permission (AX-01).** `NWB_Support_Admin` grants `ViewAllData`. Keep it only if support needs to read every record, assign it temporarily, and log its assignments.
- **Legacy named credential (AX-02).** `NWB_DocumentStore` uses the legacy format without authentication. Move it to a secured endpoint with an external credential, like the two other integrations.
- **Sharing keywords.** `CustomerSyncBatch` runs `without sharing`, which is expected for a system job. `SsoRegistrationHandler` has no sharing keyword, which is the norm for a registration handler. No axis.
- **Test classes.** The ratio of test classes is low in number but each class covers one service; the org coverage must be read in the org before concluding.

3.2 Easy — user experience and operations

Signal	Priority	Observed	Evidence in the metadata
Custom objects without description	P3	1	`LoanDocument__c`
Components that look unused (to confirm)	P3	1	`apex LegacyRateHelper`

- **Unused components (AX-03).** `LegacyRateHelper` is reached by its test only. Confirm and delete it; the draft flow already excluded from the TAD can be deleted at the same time.
- **Object description (AX-05).** `LoanDocument__c` has no description: add one, it feeds the schema builder and this document.

3.3 Adaptable — maintainability and scalability

Signal	Priority	Observed	Evidence in the metadata
Apex and triggers on old API versions	P3	1	`LegacyRateHelper (45.0)`
Record-triggered flows and Apex triggers on the same object	P3	1	`Lead: LeadTrigger + Lead_Assign_Branch`

- **Flow and trigger on Lead (AX-04).** Both act on `Lead`. The split (before save in Apex, after save in the flow) is sound; write it down in the trigger handler and keep any new automation on the same side.
- **Old API version (AX-03).** `LegacyRateHelper` is on API 45.0; it disappears with its deletion.

4 Improvement register

ID	Axis	Finding	Impact	Recommendation	Priority	Effort
AX-01	Access	`NWB_Support_Admin` grants `ViewAllData`	Support users can read every customer and loan	Restrict to a just-in-time assignment, audit assignments	P1	S
AX-02	Integration security	`NWB_DocumentStore` is a legacy named credential without authentication	Archive calls are not authenticated by Salesforce	Secured endpoint + external credential (OAuth or mutual TLS)	P2	S
AX-03	Cleanliness	`LegacyRateHelper` unused, on API 45.0	Dead code to maintain and test	Delete after confirmation	P3	S
AX-04	Automation	Trigger and flow on `Lead`	Order of execution unclear for newcomers	Document the split; keep one side per timing	P3	S
AX-05	Documentation	`LoanDocument__c` without description	Weaker self-documentation	Add descriptions to specific objects and fields	P3	S

5 Roadmap

Horizon	Axes
Next release	AX-01, AX-02
Next quarter	AX-03, AX-04, AX-05

Appendix

Components that look unused

Type	API name	Reason
apex	`LegacyRateHelper`	name suggests legacy; referenced only by test classes
